WEEK 9	BLOOM			2 ml	2 ml		0,5 ml						0,3 g	2 ml			1060	2.12				

* Green: See your retailer for a correct use of the product.

** The Beast: See your retailer for a correct use of the product.

Keep the temperature of your nutrient solution between 18 °C and 24 °C (never spray with cold water in order not to reduce the availability of certain nutrients). Always use de-chlorinated water. Never use water from a salt water softener, as it can leave high amounts of sodium in the water. Should this be the case, use it with a reverse osmosis filtration system.

Plants in pots: water to drip. Always water the plants with fertilizer.

As it is stated in the recipe, at pre-flowering (7 to 10 days after having changed the lighting period), the plants will have a last burst of growth (ranging sometimes even up to double their size). During this period, it is crucial to keep your **nutri+® GROW** fertilizer to avoid the incidence of nitrogenous deficiencies (yellow leaves) during the last weeks. Go to the **nutri+® BLOOM** fertilizer when the first buds appear. The amount of fertilizer varies according to the type of plant and growing conditions. This Chart may serve you as a guide. However, adjustments may be required depending on your specific needs.
